

Mycowet®

Easy and effective application using Mycowet For the best results, use the approved surfactant

Mycowet surfactant is the approved companion for Mycotak application.

Here are **3 vital reasons** why Mycowet is the right surfactant for the job:

1. Targets the plant base

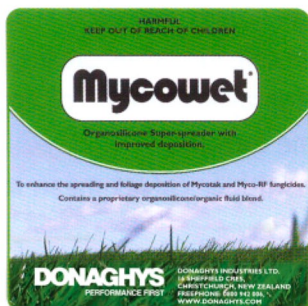

Mycowet takes the Mycotak to the base of the plant where it is absorbed and travels up and throughout the plant.

2. Fast working

Mycowet allows quick uptake of Mycotak - it is rainfast within 3 hours instead of up to 3 days in typical non-Mycowet applications.

3. Lower water rate

Mycowet increases spreading 40 fold and therefore water application rate can be reduced to 50 litres/ha - this makes helicopter application practical and economical. Without Mycowet, water rates are 100-200 litres/ha.

IDEAL SPRAYING CONDITIONS

Spraying with Mycotak and Mycowet can be used with no withholding period. For best results, spraying should begin before facial eczema spore counts rise. Starting earlier ensures optimal pasture protection and delivers positive results.

Pasture Trial

| | On unsprayed pasture | Pasture sprayed with Mycotak & Mycowet |
|--|----------------------|--|
| Weight gained Average per lactating cow | 11.9kg | 21.4kg |

Source: Pasture spraying trial of lactating cows, November 2004-January 2005.

Pasture protection was occurring even in early summer when facial eczema was not a factor.

PROTECT YOUR LIVESTOCK AND BOOST YOUR PASTURE QUALITY

Make the right decision to reduce costs, improve production, increase animal weight and protect liver condition.

Choose Mycotak and Mycowet and get your spraying programme underway today.
